J. 1. 14

Continuation of 2. NOTE: The limitation of a gate oxide formed on the substrate from the layer of silicon dioxide having hydrogen ions implanted therein is a new limitation that requires further search and/or consideration.

Continuation of 5. does NOT place the application in condition for allowance because: Applicant argues that it would have been evident to one of ordinary skill in the art what is meant by "free of metal contaminants." This is not persuasive. As explained in the rejection, there are vairous different interpretations for "free of metal contaminants." One of ordinary skill in the art would recognize that all devices have some level of metal contaminants. In the art there are many methods of reducing metal contaminants including many methods of gettering. In these methods it is recognized that the number of contaminants is reduced, but that there is still some contamination present. In paragraph 4 of page 7 of applicant's arguments it is stated that PSII reduces metal contamination. In reducing metal contaminants it is assumed that there is still some metal contaminants present. Thus, it there are metal contaminants left, it is not clear what it meant by the claim language of "free of metal contaminants.".
